ABSTRACT

A second year evaluation of the educational television series "Sesame Street" consisted of a new study to determine the effect of the revised second year curriculum goals and a followup study to determine the effects of a second year of viewing Sesame Street and the effect of the program on children who entered school after viewing for one year. This volume of the study contains data tables and figures. (JY)

- NOTE: 1. Underlined diagonals are the multiple regression of the other four measures on the indicated measure. Thus, the score on the Sesame Street test could be effectively predicted by the other four scores ($R = .87$).
2. Viewing records and TV logs had lower intercorrelations with the other measures. There was a considerable number of cases for whom these records were not kept.
